Exercise 13. A block cipher is a cryptosystem where plaintext and ciphertext space are the set $\mathcal{A}^n$ of words of length $n$ over an alphabet $\mathcal{A}$. The number $n$ is called the block length.

Show that the encryption functions of block ciphers are permutations. How many different block ciphers exist if $\mathcal{A} = \{0, 1\}$ and the block length is $n = 6$?

Exercise 14. Consider the following AES-128 key given in hexadecimal notation:

$$K = 2d\ 61\ 72\ 69\ 65\ 00\ 76\ 61\ 6e\ 00\ 43\ 6c\ 65\ 65\ 66$$

What are the first 4 bytes of round key $K_1$?

Exercise 15. Within the step MixColumns of the AES algorithm a vector $\mathbf{r} = (r_0, r_1, r_2, r_3)'$, $r_i \in \mathbb{F}_{2^8} \triangleq \mathbb{F}_2[x]/(x^8 + x^4 + x^3 + x + 1)\mathbb{F}_2[x]$ is given from $\mathbf{c} = (c_0, c_1, c_2, c_3)'$, $c_i \in \mathbb{F}_{2^8} \triangleq \mathbb{F}_2[x]/(x^8 + x^4 + x^3 + x + 1)\mathbb{F}_2[x]$, by $\mathbf{r} = \mathbf{T}\mathbf{c}$ with

$$
\mathbf{T} = \begin{pmatrix}
    x & (x+1) & 1 & 1 \\
    1 & x & (x+1) & 1 \\
    1 & 1 & x & (x+1) \\
    (x+1) & 1 & 1 & x
\end{pmatrix} \in \mathbb{F}_{2^8}^{4\times4} \triangleq (\mathbb{F}_2[x]/(x^8 + x^4 + x^3 + x + 1)\mathbb{F}_2[x])^{4\times4}.
$$

Show $(c_3u^3 + c_2u^2 + c_1u + c_0)((x+1)u^3 + u^2 + u + x) \equiv r_3u^3 + r_2u^2 + r_1u + r_0 \mod u^4 + 1$.
